DETAILED ACTION

Claims Under Prosecution

1. Claims 1-21 are pending and under examination.

Priority

2. An application in which the benefits of an earlier application are desired must contain a specific reference to the prior application in the first sentence of the specification, including the status of the application, i.e. abandoned or patent number, or in an application data sheet (37 CFR 1.78(a)(2) and (a)(5)).

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claim 21 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 21 is vague and indefinite in reciting "first microparticles of 30 to 600 nm in diameter having a refractive index ..., and second microparticles of 30-600 nm in diameter having a refractive index ... said first microparticles have stronger light scattering properties than said second microparticles" because there is no specific size definition, as in diameter, so as to effect differentiation between particles with strong light scattering properties and those with weak light scattering properties in the claim.

Art Unit: 1641

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

4. Claims 1-8, 10-12, 18, and 21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Grange et al. (Journal of Immunological Methods, 18: 365-375 (1977)) in view of Lindmo et al. (Journal of Immunological Methods 126: 183-189 (1990)).

Grange et al. teach a reagent comprising light scattering microparticles having specific binding partners (antigens and antibodies) covalently bound thereto for use in agglutination or nephelometric assays (see Abstract). Grange et al. teach that sensitivity in nephelometric assays is dependent upon the reactivity (affinity) of the immunological binding partners being titered, the ratio of antigen to antibody- near

Art Unit: 1641

equivalence, and the medium in which reaction takes place (see Introduction). Grange et al. specifically teach that light scatter is amplified by increasing "molecular size" antigens or antibodies by adsorbing them into the microparticles with light scattering properties. Grange et al. also teach that intensity of light scatter by a given suspension of microparticles is dependent on the size and number of the particles. Other factors that influence the intensity of light scatter includes shape, dimension, refractive index, and polydispersity of the microparticles (see page 366, last paragraph bridging to page 367). Grange et al. further teach the influence of wavelength, microparticle concentration, angle of observation, and reaction time in agglutinated (aggregated) particles (see Figures 1-8). In determining reactivity (specificity) between binding partners coated into microparticles, the light scattered by microparticles which have interacted show significantly increased light scatter and is proportionate to the concentration of the antigen (see page 373).

Grange et al. differ in failing to teach differential characterization between two microparticle populations. Grange et al. also fails to teach differential reactivity and dissociation constants between two immunological binding partners coated therein.

Lindmo et al. teach reagents having two distinguishable microparticle types for use in immunometric assays. Lindmo et al. specifically teach the two populations of microparticles as distinctly having 7um and 10um in diameter. Both microparticle types are coated with binding partners (antibody) having the same specificity but different reactivity (affinity) and having association constants of 3.2 x 10¹⁰ and 3.2 x 10⁹ for the 7um and 10um, respectively (see Introduction). Lindmo et al. teach that at low antigen concentrations, binding preferentially occurs on the high reactivity microparticles and the low reactivity microparticles show increase in binding with increasing antigen concentration even after binding to the high affinity particles has been saturated. This

Art Unit: 1641

results in increase in dynamic range for the assay without compromising the high sensitivity provided by the high affinity particle (see page 184, column 2, last paragraph). Figure 2A shows a double standard curve obtained by differentially plotting the mean channel number of the fluorescence distribution for both microparticle populations as a function of antigen concentration in the sample (see page 186, second, third and fourth paragraphs). High reactivity microparticles exhibit significant binding in comparison to low reactivity microparticles at 0.2 ug/l concentration (see Figure 2A and page 186). Lindmo et al. teach that in binary mixtures, the measurements obtained from high reactivity microparticles provide high precision in the low concentration range whereas measurements from low reactivity microparticles provide precision in the high concentration range (see page 187, second column). Lindmo et al. also teach populations of microparticles with uniform sizes at a given ratio or concentration separated by differing sizes and immunological binding partners with specific reactivities, i.e. dissociation constants, or association constants at a given ratio and concentration (see Lindmo et al., page 184-185).

One of ordinary skill in the art at the time of the instant invention would have been motivated to incorporate the teachings of Lindmo of a reagent comprising a binary mixture of microparticles into the microparticulate reagent mixture of Grange because Lindmo specifically taught that his binary microparticles with high and low reactivities can easily be incorporated with the concept of various mixtures of distinguishable microparticles coated with antibodies of different specificities in a simultaneous or homogeneous assay of analytes such as in the teaching of Grange.

Art Unit: 1641

5. Claim 9 is rejected under 35 U.S.C. 103(a) as being unpatentable over Grange et al. (Journal of Immunological Methods, 18: 365-375 (1977)) in view of Lindmo et al. (Journal of Immunological Methods 126: 183-189 (1990)) and in further view of Sutton et al. (US 5,330,891).

Grange et al. and Lindmo et al. have been discussed supra. Grange et al. and Lindmo et al. differ in failing to teach that the analyte tested for is nucleic acid and the binding partners are oligonucleotide probes.

Sutton et al. disclose microparticulate reagent for use in detecting nucleic acids wherein the microparticulates have polyoxyalkylene side chains having an oligonucleotide probe covalently attached thereto through reactive groups. The oligonucleotide probe is complementary to the nucleic acid analyte.

One of ordinary skill in the art at the time of the instant invention would have reasonable expectation of success in covalently attaching oligonucleotide probes such as taught by Sutton into the microparticles taught by Grange and Lindmo in order to create a reagent for detecting nucleic acid analytes because oligonucleotide probes constitute obvious variations of species of binding partners which are specific for nucleic acids and which are routinely varied in the art and which have not been described as being critical to the practice of the invention.

6. Claims 13-17 and 19-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Grange et al. (Journal of Immunological Methods, 18: 365-375

Art Unit: 1641

(1977)) in view of Lindmo et al. (Journal of Immunological Methods 126: 183-189 (1990)) and in further view of Harchali et al. (Clin. Chem. 40 (3): 442-447 (1994)).

Grange et al. and Lindmo et al. have been discussed supra. Grange et al. and Lindmo et al. differ in failing to teach the composition of the microparticles in the reagent wherein the microparticles are coated with binding partners (antigens) with varying defined epitopic specificities.

Harchali et al. teach light scattering microparticles which are polyacrylic, polyfunctional, copolymerized microparticles conjugated with antigens of defined epitopic specificity used for agglutination assays and microparticle-enhanced nephelometric assays (see Abstract).

It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the use of two types of particles conjugated with antigens of differing reactivity as taught by Lindmo and further apply the teachings of Harchali in incorporating defined epitopic specificities, with the teachings of Grange in manufacturing microparticles for use in agglutination assays because Lindmo specifically taught binary microparticle reagents with high and low reactivities can be combined with the concept of using a mixture of distinguishable particles coated with antibodies of different specificities or same specificity but different reactivity towards differing epitopes in a simultaneous or homogeneous assay of antigens such as in the teachings of both Grange and Harchali.

7. For reasons aforementioned, no claims are allowed.

Information Disclosure Statement

Application/Control Number: 09/827,846 Page 8

Art Unit: 1641

8. The Information Disclosure Statement (PTO-1449) filed 7/12/01 in Paper No. 2 is acknowledged. Reference C6 was not considered because neither an English translation nor a statement of relevancy was provided therefor.

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Gailene R. Gabel whose telephone number is (703) 305-0807. The examiner can normally be reached on Monday to Thursday from 7:00 AM to 4:30 PM. The examiner can also be reached on alternate Fridays from 7:00 AM to 3:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, James Housel, can be reached on (703) 308-4027. The fax phone number for the organization where this application or proceeding is assigned is (703) 308-4242.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 308-0196.
